

Enably | MVP Goal

Create a working version of Enably that:

- Sets up a basic email outreach system
 - Guides users through a conversational sales operationsl setup process
 - Delivers a simple sales enablement plan with lead management and reporting.
-

Step 1: Define the MVP Scope

Based on your Enably doc and ideas, let's narrow it to these core features:

- **Conversational Setup:** A chatbot asks users about their business and goals.
 - **Email Outreach:** Sets up and warms an email account, sends basic sequences.
 - **Lead Management:** Uploads leads and tracks them in a lightweight CRM.
 - **Reporting:** Shows daily email activity (sent, opened).
-

Step 2: Build the Email Infrastructure

Your email setup ideas are spot-on—let's execute them.

1. **Set Up a Messaging Domain with Route 53**
 - Purchase a domain (e.g., enablsales.com) via platforms like Vercel, Godaddy, CheapDomains, Google Cloud Console, Route 53, etc (~\$12/year).
 - Configure DNS records (SPF, DKIM, DMARC) using guided setup.
2. **Set Up Email Sending**
 - Create an email inbox setup process using SES, Resend or other tools
3. **Warm Up the Email Account**
 - Manually send 20-50 emails/day to real contacts for 7-14 days (or use a tool like Warmup Inbox, ~\$15/month).
 - Automate this later (post-MVP).
4. **Use SNS for Tracking**
 - Configure notifications (e.g., email sent, bounced) via SNS, Twillio, etc
 - Log these in database for reporting.

Outcome: A functional email system ready for outreach.

Step 3: Build the Chatbot

1. Design the Flow

- Create a chatbot with these steps:
 - “Hi! I’m Enably. What’s your business name and website?”
 - “Who’s your target audience? (e.g., SMBs, Enterprises)”
 - “What’s your main goal? (e.g., Lead gen, Sales meetings)”
 - “Upload your leads here” (link to a file upload UI).
- Time: ~2-3 hours.

2. Connect to CRM

- Send user answers to CRM using tools like v0 actions and AWS Lambda
- Lambda/other tool saves data to Database (e.g., BusinessInfo table).

Outcome: A chatbot that collects key info and kicks off the process.

Step 4: Set Up Lead Management and CRM

You want a system to handle leads and track activity—let’s keep it simple with DynamoDB.

1. Create Database Tables

- **Leads:** Columns: Name, Email, Company, Status (e.g., “New,” “Contacted”).
- **Activity:** Columns: LeadID, Action (e.g., “Email Sent”), Timestamp.

2. Lead Upload

- Build a basic React page with a CSV upload button (e.g., using react-dropzone).
- Parse the CSV in a serverless function tool and save to database

3. Basic CRM Config

- Let users view leads in a table (Name, Email, Status, etc) and allow card view.
- Add a “Send Email” button to trigger outreach.
- Have section for AI powered research insights on lead and company

Outcome: A lightweight CRM to manage leads.

Step 5: Automate Outreach

Your sequencing and messaging ideas fit here.

1. Write Message Templates

- Store templates in database
 - Cold: “Hi [Name], I noticed [Company] is in [Industry]. Let’s connect!”
 - Follow-up: “Hey [Name], following up—any thoughts?”
- Use placeholders for personalization.

2. Create Sequencing

- Use serverless functions and email outreach tools (like resend/make) to:

- Send cold email on Day 1.
- Check SNS for replies; if none, send follow-up on Day 4.
- Filter out bounced emails.

Outcome: Automated emails with basic logic.

Step 6: Build a Simple UI and Dashboard

You listed UIs for tasks, templates, and analytics—let's combine them into one.

1. React Frontend

- **Home Page:** Upload leads, view/edit templates, see tasks (e.g., "Send to 10 leads").
- **Dashboard:** Show "Emails Sent Today" and "Open Rate" using Chart.js.
- Connect to database and serverless functions

2. Tracking Mechanism

- Track sent/bounced; add open tracking with a pixel (basic HTML in emails).
- Log everything in Database

Outcome: A single-page app users can interact with.

Step 7: Add Reporting

Your daily reporting idea is key for user trust.

1. Daily Summary

- Use serverless functions daily and send a report: "Sent: 50, Opened: 10."
- Or display it on the dashboard.

2. KPIs

- Track: Emails Sent, Opens, Replies.
- Add more (e.g., Sales Meetings) post-MVP.

Outcome: Users see results without effort.

Step 8: Test and Launch

- Test with 10 leads—upload a CSV, run the sequence, check the dashboard.
- Share with 3-5 users (e.g., LinkedIn contacts) for feedback.
- Launch free or cheap (~\$50) to get early adopters.

Tech Stack (Options)

- **Vercel:** domains, deployment serverless functions (v0 actions), etc
- **Supabase:** database management
- **Clerk.dev:** Authentication
- **v0.dev:** web development
- **AWS:** Route 53 (domain), SES (email), SNS (tracking), DynamoDB (data), Lambda (logic), API Gateway (UI connection).
- **Frontend:** React, Chart.js.
- **Chatbot:** Voiceflow, v0, etc, openai

Integrations

1. **CRM:** Hubspot, Apollo, PipeDrive
2. **Email Outreach:** PipeDrive, Apollo, Hubspot, Reply, [Make.com](#), Resend
3. **Automation:** [Make.com](#), n8n, Lindy, Gumloop
4. **Database:** Supabase, Firebase, etc
5. **Deployment:** Vercel, AWS, Netlify
6. **Lead Generation:** Apollo, Apify

Overview

- **Core Identity:** Your MVP delivers a “single source of truth” for basic outreach (per your doc).
- **Capabilities:** It covers ecosystem design (email + leads) and content (templates).
- **Scalability:** Add methodologies (e.g., BANT) or CRM integrations (e.g., HubSpot)

Ready to start? Pick Day 1 (email setup) and go for it—I can guide you through any step. What do you think?
